### ABSTRACT

The penetration of information technology has given a new impetus to the development of cities. At the same time, the rapid growth rates of cities create problems in providing food for their residents. In the article, the authors assess the provision of food products to residents of smart cities in Belarus. The results of the study showed that even though prices in different regions for the same products may vary significantly, deviations in the cost of the food basket will be insignificant, that is, they will be within the permissible value of the mathematical error of the calculations performed.

**KEYWORDS:** food security, consumer spending, consumer prices, price index, urban agriculture, peri-urban agriculture

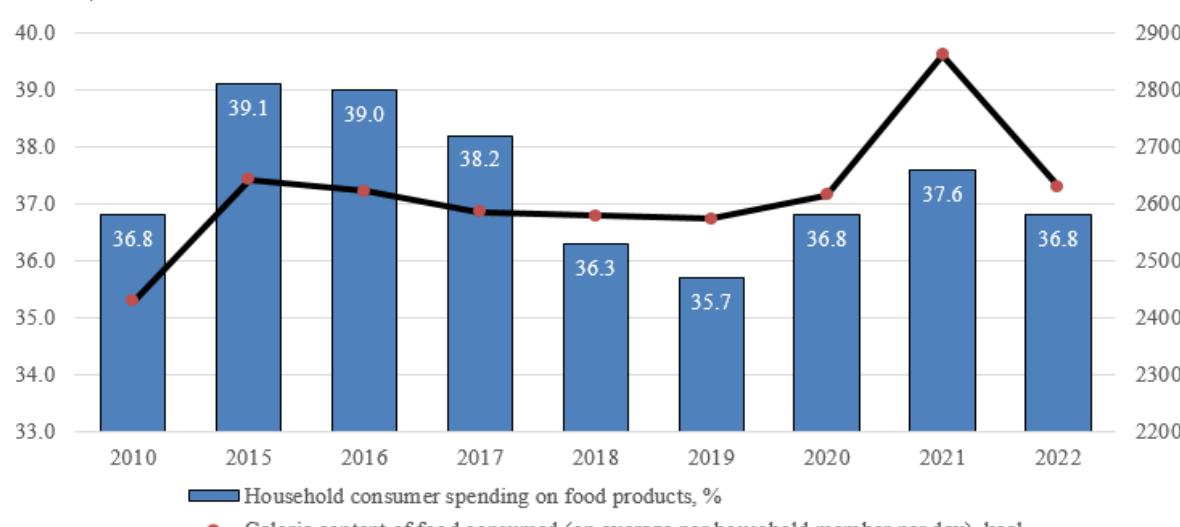

### Introduction

*Creating comfortable living conditions in "smart cities" is closely related to solving the problem of providing their residents with food and its accessibility, as well as the simultaneous development of urban and suburban agriculture. In world practice, these issues are regulated by ISO 37120:2018, ISO 37122:2019 and ISO 37123:2019. Identical standards have been introduced and are in force in the Russian Federation. They identify the main indicators characterizing the financing of initiatives in food security, urban and suburban agriculture development, collection and disposal of household food waste, and coverage of the online cartographic system of food suppliers (Karpovich, Drahun 2023). In the Republic of Belarus, the issues of providing residents with food are regulated by the doctrine of national food security, developed for the period up to 2030 (National Center, 2023).*

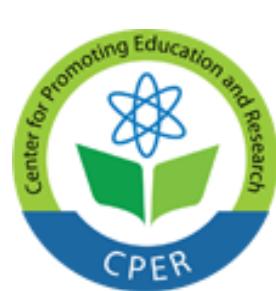

### Results

By the "Model Concept for the Development of Smart Cities in the Republic of Belarus", Minsk, regional centers, and 11 regions (Baranovichi, Pinsk, Novopolotsk, Orsha, Polotsk, Mozyr, Lida, Borisov, Soligorsk, Molodechno, Bobruisk) are involved in the process of digital transformation (Ministry, 2024). *The development of the food supply system for "smart cities" is not provided for in the framework of the adopted documents.*

According to the Doctrine of National Food Security of the Republic of Belarus, the share of food costs in the structure of consumer spending should not exceed 35.0%. However, in practice, household spending on food products in 2010-2022 varied in the range of 35.7–39.1%, which is higher than the acceptable value of 35.0% (Figure 1).

**Figure 1.** Changes in the structure of consumer spending of the population of the Republic of Belarus in 2010-2022, % (Belstat, 2024)

The excess of the share of food costs, as well as the failure to achieve a rational norm of the energy value of the diet of 3400-3500 kcal, indicates a lack of income for the population. The solution to this problem is based on the need to develop and take measures aimed at increasing the real incomes of the

population, including by curbing unjustified price increases for food products of domestic and imported production.

The dynamics of changes in the level of prices for food products in Belarus, nuclear power plants, neighboring countries, and the world are presented in Table 1.

**Table 1.** Consumer price index, in% compared to the previous year

	Consumer price index, in% compared to the previous year

The world as a whole	101,4	101,6	102,2	102,4	102,2	101,9	103,4	108,0

Note: the source EEC (EEC, 2024)

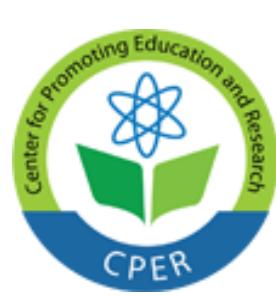

The analysis of the consumer price index indicates that in Belarus in the period under review, the highest growth rate of consumer prices was observed both about world prices and within the EAEU, except certain years when the price growth

rates in the Russian Federation and Kazakhstan were higher. In part, this situation may be related to lower prices for identical goods in Belarus and other countries, which remain at present.

**Table 2.** Average consumer prices in the EAEU member States for food products for November 2023, US dollars per unit of measurement

## Discussion

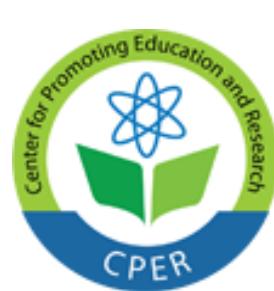

At the same time, the difference in the price level for individual commodity items in different EAEU countries contributes to the development of mutual internal trade. Belarus has the greatest competitive advantage in this area of cooperation since its prices are lower for most items. However, this situation may negatively affect the pricing strategy of exporters when setting prices or providing discounts to buyers, since the price of

products is the determining factor that shapes the organization's profit in the market and its competitiveness (Karpovich, 2022).

An analysis of average prices for individual food products in retail trade organizations in Belarus showed that regardless of the region, the republic maintains a fairly even price level (Table 4). At the same time, it can be seen that higher prices for some goods of one group are offset by lower prices for goods from another.

**Table 4.** Average prices for individual food products in retail organizations, BYN

Note: the source [4]

The calculation of the average annual regional price index proves the apparent "price leadership" of the Mogilev region, despite their stability and balance.

## Conclusion

Thus, the analysis of the price situation on the market of agricultural products and food products showed that despite the failure to achieve certain indicators of food security, relatively high rates of price growth for food products remain low in the Republic of Belarus for the main food groups. At the same time,

we consider it advisable, within the framework of the implementation of the concept of "smart cities" in Belarus, to develop regional (urban) programs to ensure food security, the development of suburban and urban agriculture to make more effective use of land plots not involved in economic turnover in the conditions of the common agricultural market.
